TSR immersion probes

Construction and operating principle

The TSR immersion probes have a probe tube with built-in reed contacts. The float is fitted with a permanent magnet and moves freely up and down the probe tube, activating the reed contacts as it rises and falls.

It should be noted that reed contacts do **not** lock but that they switch only for as long as they are influenced by the magnetic field. Once the float passes beyond a contact upwards or downwards, the latter returns to its original position. However, the contacts can be made to hold by using collars to limit the motion of the float.

Example of a TSR with 2 NO contacts

Explanation of abbreviations

NO contact = normally open contact

NC contact = normally closed contact

OC contact = changeover contact

TSR immersion probes

Available electrical versions

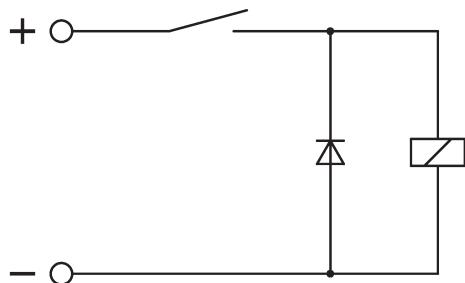

For use outside potentially explosive atmospheres, the customer can choose the version TSR/3/... or TSR/1/... (not suitable for the immersion probe TSR/0/ED/E6, see page 3-1-19).

	TSR/3/...	TSR/1/...
Switching voltage	between AC/DC 24 V and 250 V	between AC/DC 1 V and 42 V
Switching current	between AC 100 mA and 2 A (0.4 A)	between AC 1 mA and 500 mA
Switching capacity	max. 100 VA	max. 20 VA

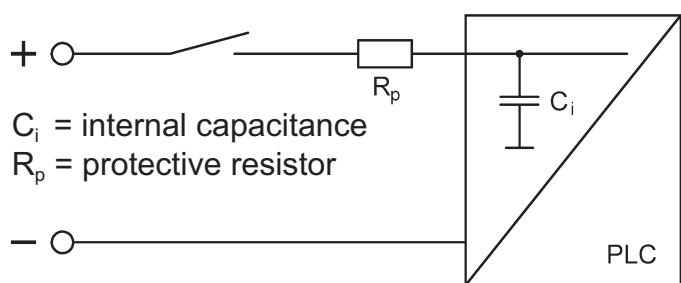

A protective circuit adapted to the electrical installation has to be provided for working with inductive or capacitive loads.

Example:

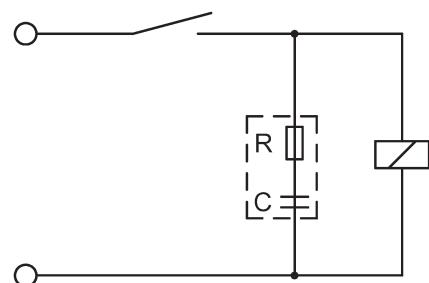

with inductive load (DC)

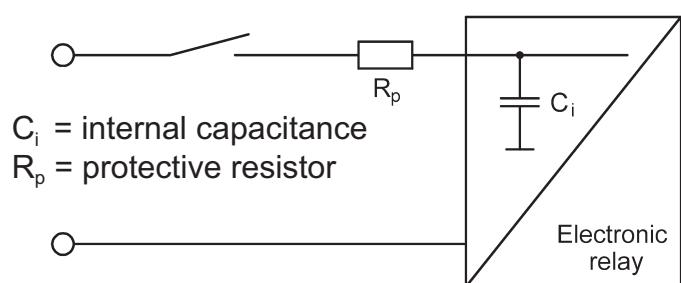

with capacitive load (DC) (PLC inputs)

with inductive load (AC)

with capacitive load (AC) (electronic relay)

Caution!

If a TSR immersion probe is to be used with a KR protection relay, you must choose the model TSR/1/....

We recommend this apparatus combination.

Application examples

• Automatic emptying of a tank

The float rises with the liquid to the maximum level and trips the NO contact which in turn sets the pump in operation via the sequential circuit.

Liquid is pumped out. When the minimum level is reached, the NC contact at the bottom is activated, thus interrupting the holding circuit via the sequential circuit and finishing the pump operation.

• Automatic filling of a tank

The float falls with the liquid to the minimum level and trips the NO contact which in turn sets the pump in operation via the sequential circuit.

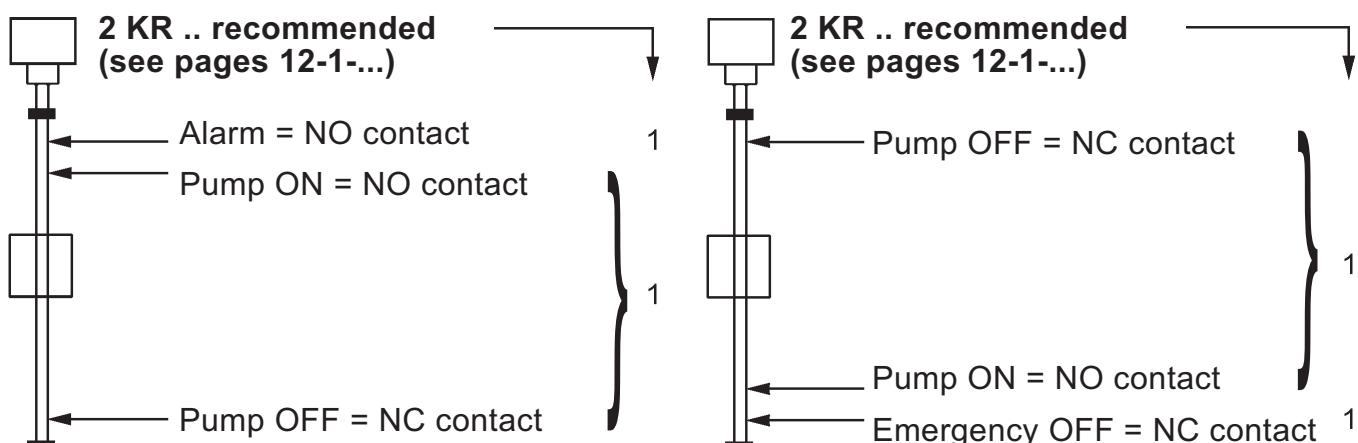

Liquid is then pumped in. When the maximum level is reached, the upper NC contact is activated, thus interrupting the holding circuit via the sequential circuit and finishing the pump operation.

Examples for standard applications

• with 1 float and 1 collar fitted above the upper contact

It is recommended to fit an additional collar above the upper contact. This allows a contact switching after a circuit failure by avoiding that the rising of the liquid brings the float outside the area of influence of the magnet on the contact.

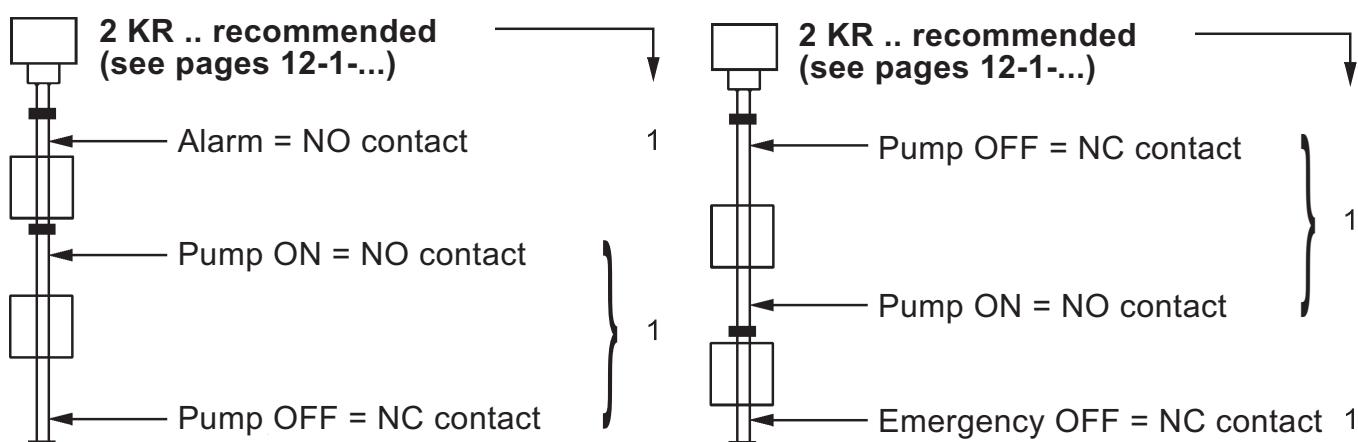

The probe tube should be of such a length that when the float reaches the lower contact, it rests on the holding washer. The recommended distance between the lower contact and the end of probe tube corresponds to the min. distance as specified in the table under the technical data of the individual TSR models.

• with 2 or more floats and corresponding collars

In order to make sure that not only the upper contact and lower contact are held after activation, it is possible to use several floats together with the corresponding collars.

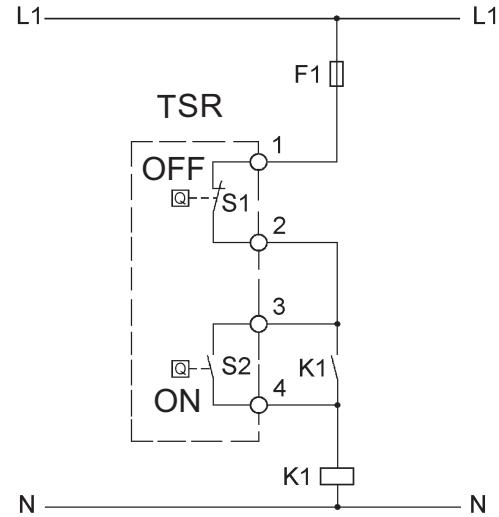

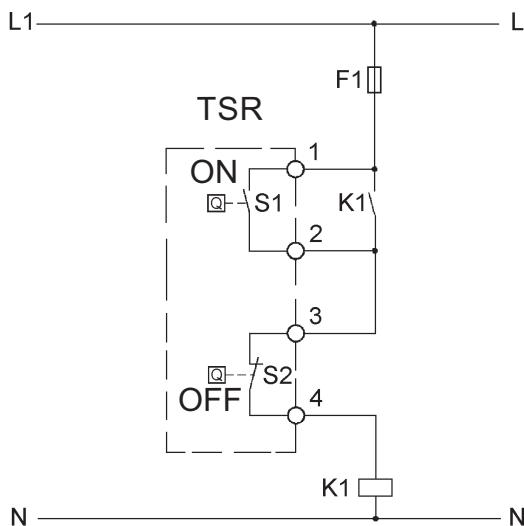

Please respect the min. distances between contacts for these applications.

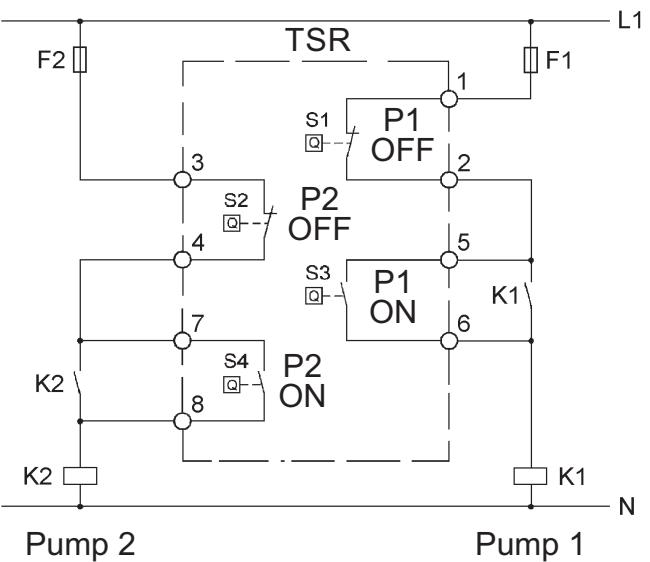

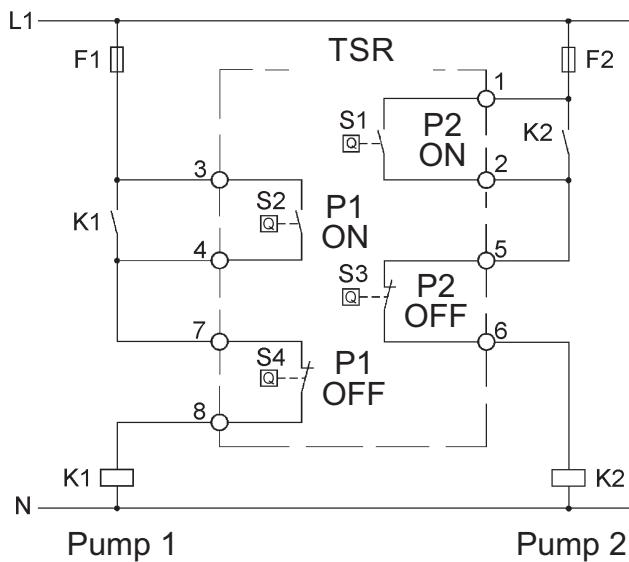

Basic circuit diagram for emptying

Basic circuit diagram for filling

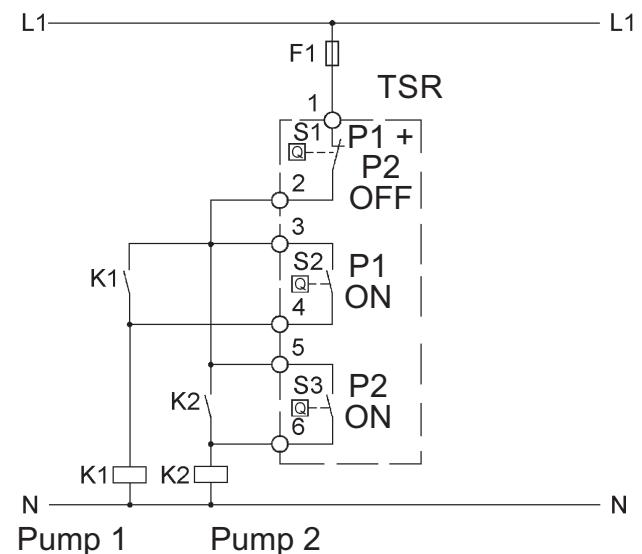

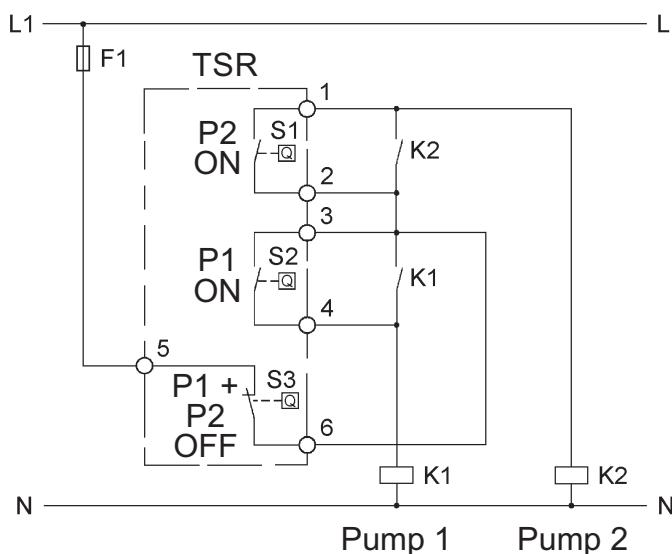

using a TSR for 1 pump

using a TSR for 2 pumps

using a TSR for 2 pumps with a common switch-off contact

The above contact positions correspond to a liquid level situated between the respective switch-on and switch-off points.
